## Parallels Desktop For Mac OS X

It is a great prospect and now even Apple is recommending running Parallels on their Get A Mac site. That's the corporate equivalent of Jesus endorsing your sandals. Introduction/parallels Desktop 1.0 for Mac OS X Developer Parallels product page/system requirements: Any Mac with an Intel CPU, Mac OS X 10. Parallels promises to be a big upgrade from the poky and painful Virtual PC emulation. @ product for MacOsX For those that are just getting to the party, here's a bit of a breakdown on virtualization. In Parallels Desktop 10 for Mac, support for guest operating systems includes a variety of 32-bit and 64-bit x86 operating systems, including MS-DOS. Multiple versions of Windows, including Windows 8 and Windows 8. 1A, 512MB of RAM, 30MB free drive space/Price: US\$79.99 (US\$49.99 through July 15) Move over emulation, virtualization is in and it's better than two Jessica Albas wrestling the devil himself in a pit of molten steel. Click for high res When that page went up, the price of Parallels too so coincidentally went up from \$50 to \$80, so let this be a lesson to us all: never say 'wow, that's so cheap' on a public forum again. The idea is that program acts as a virtual machine (VM) and its job is to belie PC (one of the more boring IT/ma classes), tricking the client OS into thinking it's inside a real x86 machine with a physical hard drive, keyboard, Ethernet card, etc. We help businesses and individuals securely and productively use their favorite devices and preferred technology, whether it's Windows®8, Mac®8, iOS, Android™. The benefits are pretty clear over a real PC: It's running on the Mac you know and love but you're not sacrificing access to the occasional Windows-only app that you might need.

Not even the Hulu Hoop can stop this one Okay, virtualization isn't totally new—it's just new to Macs and Parallels Desktop is the first out the door with a 1. It's no contest, virtualization has it all: multiple operating systems running on the same machine at nearly the full speed of the host's processor with each system seamlessly networking with the next... when in reality, it's merely grabbing unused CPU cycles and RAM inside another OS to do it's thing. 1 (Windows 8 1 must generally be installed from a DVD Mac OS X Leopard Server Parallels Inc. , a global leader in cross-platform solutions, makes it simple for customers to use and access the applications and files they need on any device or operating system.

Maybe you have a copy of Office XP for Windows and don't want to shell out for the Mac version. Add to that the fact that it's cheaper than getting a new machine and you have the guaranteed latest crash... Still, that's still cheaper than the \$129 charges for the Virtual PC standalone package and if it works as advertised, it's hard to compare the two. Sure, you could load up Apple's Boot Camp, but using a program like Parallels—or its competitors VMWare, WINE and MS Virtual PC—means you don't have to reboot just to use that accounting program at work. So let's see if it's the cheap and fast hybrid PC we've all been waiting for. Minimum requirementsAny Intel Mac (doesn't require a machine with VT-x support) A minimum of 512 MB of RAM, 1 GB recommended 30 MB of available HD space for Parallels plus enough room for the VM OS OS X 10.
